

# LACTOIOD HV

Ready-to-use liquid filming sanitising solution ideal for post-milking (post-dipping) udder hygiene.

The product contains elementary iodine (2500 ppm) in association with natural lactic acid. The synergy of these two active ingredients guarantees an elevated level of sanitisation of the skin, increasing the ease of penetration into the organic sub-layers, at the same time eliminating the corrosive and irritative properties of free iodine.

It also contains two active ingredients with softening action (glycerine and lanolin) which prevent the formation of reddening and chapping, especially during cold periods.

## USE MODALITY

With cup applicator:  
Immerse the teats in the neat product immediately after milking, using the special cup.  
Leave to dry.
